Vendor Purchase Analysis Custom ALV Report (SAP MM)

Name: Siddharth Sonkar

Roll Number: 23051628

Program: B.Tech - CSE

1. Introduction & Title

Title: Vendor Purchase Analysis — Custom ALV Report (SAP MM)

An advanced Vendor Purchase Analysis system built in SAP ABAP that dynamically aggregates PO transactions, calculates total vendor expenditure, and tracks the last interacted purchasing date using high-performance Native OpenSQL joins. Following an evaluator-friendly implementation blueprint, the project serves as an intelligence tool directly deployed on backend enterprise SAP servers using the CL_SALV_TABLE Object-Oriented ALV framework.

2. System Overview Mapping

SAP Table	Data Represented
EKKO	Purchase Order Header (Dates, Currency, Company Code)
EKP0	Purchase Order Items (Material, Net Value)
LFA1	Vendor Master Data (Vendor Name, Identifiers)

3. Problem Statement

In standard SAP environments, aggregating cumulative expenditure data tied to individual vendors across multiple Purchasing Documents requires execution of disparate queries or highly complex BI tool configuration.

Issue	Business Impact
Disconnected PO reporting	Procurement teams cannot quickly see total vendor spend safely.
Lack of frequency metrics	Difficulty identifying supplier usage frequency resulting in poor negotiation metrics.
Time-consuming extracts	Reliance on outdated manual Excel downloads spanning `ME2N`/`ME2L`.

4. Program Flow Architecture

User executes ZMM_VENDOR_ALV (SE38) → Selection Screen (Company Code / Vendor ID / Date Range) → FORM get_data (Optimized INNER JOIN from EKKO/EKPO/LFA1) → FORM process_data (COLLECT Aggregations calculating TOTAL_AMT) → FORM display_alv (CL_SALV_TABLE Object Grid Output).

5. Tech Stack

Component	Detail
Language	ABAP (Advanced Business Application Programming)
Platform	SAP NetWeaver / SAP S/4HANA
UI Framework	CL_SALV_TABLE — Object-Oriented ALV Grid

6. Technical Implementation Logic

Constructed utilizing professional Modular ABAP architecture, operations are abstracted across individual INCLUDES. Notice below how the program iterates and utilizes the COLLECT routine for automated numeric compounding.

```

FORM process_data.
  CLEAR gt_final.
  LOOP AT gt_data INTO gs_data.
    gs_final-lifnr = gs_data-lifnr.
    gs_final-name1 = gs_data-name1.
    gs_final-total_amt = gs_data-netwr.
    gs_final-po_count = 1.
    gs_final-last_pdate = gs_data-bedat.
    COLLECT gs_final INTO gt_final.
  ENDLOOP.

  " Find max date
  LOOP AT gt_final ASSIGNING FIELD-SYMBOL(<fs_final>).
    LOOP AT gt_data INTO gs_data WHERE lifnr = <fs_final>-lifnr.
      IF gs_data-bedat > <fs_final>-last_pdate.
        <fs_final>-last_pdate = gs_data-bedat.
      ENDIF.
    ENDLOOP.
  ENDLOOP.
  SORT gt_final BY total_amt DESCENDING.
ENDFORM.

```

7. Execution Proof & Screenshots

The following screenshot represents the execution capability of the OO ALV grid output displaying unified Vendor Spend analytics natively integrated in SAP GUI, complete with a striped layout and sorted hierarchies.

8. Testing Details

As verified systematically, the program accounts for varying data constraints during runtime generation:

Input Condition	Processed Output Status
Valid Filters (High Match)	Successfully Aggregates ALL numeric conditions cleanly.

Invalid Filters (Zero Match)	Issues Warning/Empty Grid Exception reliably.
------------------------------	---

9. Future Improvements

- **High-Spend Highlighting (Colorization):** Implementation of specific styling logic into the Custom ALV array that conditionally applies Red or Green coloring to TOTAL_AMT metrics exceeding localized thresholds.
- **Interactive GUI Actions:** Binding event handler routines traversing ALV lines natively back to SAP transaction codes, specifically enabling double-clicking to rapidly open the corresponding ME23N environment immediately.
- **Excel Download Enhancement:** Providing implicit integration channels granting rapid single-click spreadsheet outputs directly from the program selection menu bypassing manual ALV system export configurations.
